

**Did you know?**

*You're benefiting from solar power!*

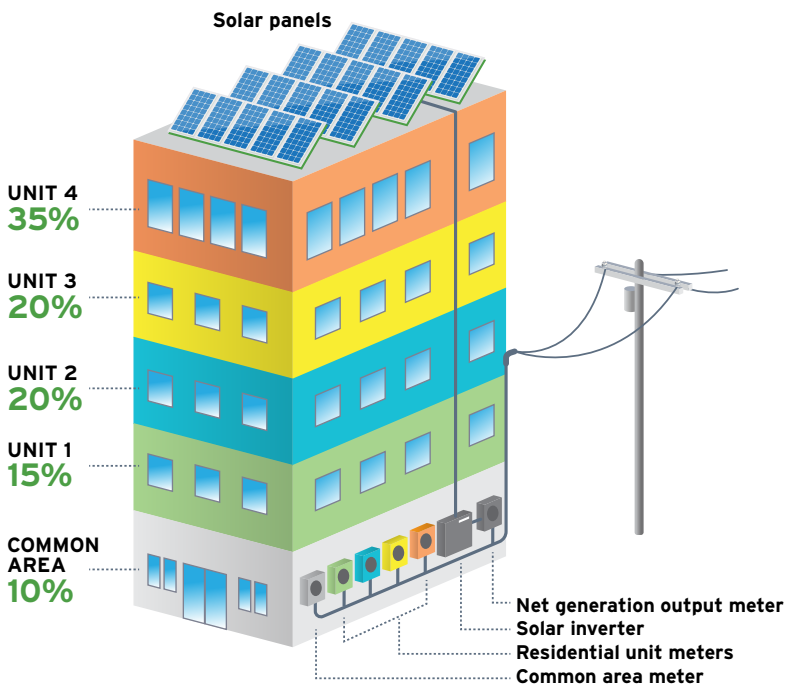

## Solar-Powered Communities

**This building is equipped with solar panels!** Solar not only contributes to a greener environment, but also supports California's ambitious clean energy goals.

As residents, you benefit from a portion of the export credits generated by our solar system each month. These credits can be found on your SDG&E® Virtual Solar Billing Plan bill.

To save even more on your bill, shift energy use away from on-peak hours. Use high-energy appliances like dishwashers, dryers and washing machines outside of on-peak hours of 4 p.m. to 9 p.m.

Thank you for being an essential part of our eco-friendly community and helping us make a positive impact on the environment.

### How the Virtual Solar Billing Plan works

The Virtual Solar Billing Plan (VSBP) allows several customers to share a single solar system. The plan is for properties with many tenants, like apartment complexes and office buildings.

#### The image to the left shows an example of Virtual Solar Billing:

The owner of this four-unit apartment building installed a solar system. Each of the four units plus the common area receives a portion of the solar system's output each month.

In this example, the building owner has assigned the tenant living in Unit 3 to receive 20% of the solar system's output. If Unit 3's portion (20%) of the solar system sends more energy (exports) to the grid than it uses (imports), the tenant will receive export credits to offset their bill.

Although the building's total usage is calculated through a single meter, tenants still receive an individual bill that's due each month that highlights charges and credits.
